Technology has accelerated the rate of business. Amplifying the speed behind the processes and services necessary to function in a 24/7 environment is crucial to a company’s competitiveness. Innovative companies understand financial and operational benefits that come from partnering with a managed service provider that can help them adopt a unified communications strategy–a strategy that is faster, easier and more cost-effectively deployed with cloud-based tools.

Bright House Networks portfolio of voice, data, cloud and managed services combines the strength of its reliable all-fiber network and the versatility of its multi-faceted, cloud-based features and services. Supported by a locally-based, dedicated team of engineers and technicians, Bright House delivers some of the most advanced unified communications solutions in the nation.

Unified communications integrates real-time communication services to provide a unified user interface and experience across various devices and media. It eliminates the need for capital investments and ongoing overhead by enabling businesses to harness the cloud as a platform to deploy communications devices and applications on a pay-as-you-go basis. The fully scalable solution can meet the diverse needs of any business.

“With our fully-owned private fiber optic network and managed services offerings, Bright House Networks is uniquely positioned to offer our clients cloud-based unified communications along with a broad array of network capabilities and industry-leading support,” says Craig Cowden, senior vice president of Network Engineering and Operations and Enterprise Solutions, Bright House Networks.

Reliable unified communications services from a trusted partner have emerged as a top priority for today’s IT leaders, who are increasingly challenged to create and manage scalable communication platforms to support and increase productivity of local and remote workforces. Cloud-based services minimize upfront and ongoing maintenance costs while allowing IT resources to focus on supporting strategic business needs rather than managing the network infrastructure.

Cloud-based unified communications services enable companies to keep pace with technological advances through automatic upgrades at no additional costs. They are also highly scalable to quickly address the changing needs of a growing business.

Bright House Networks addresses those needs and expectations. It offers a unique proposition because, unlike Value Added Resellers, it owns and operates its network end-to-end so it takes complete accountability for performance. And unlike national providers, Bright House Networks is a local company, with management, technical expertise and customer care located right in the Central Florida region to provide continuity of service that’s only a phone call away.

Companies positioned for rapid growth or exploring ways to manage the myriad of challenges in today’s tough environment are turning to the Bright House Networks team. Bright House’s expertise in cloud services allows it to provide a comprehensive managed service solution that is powerful, reliable and cost-effective to help businesses focus on their business, not managing their network.

Harnessing the Power of Unified Communications

Bright House Networks delivers cloud-based and managed services for Florida businesses.

Bright House Networks provides businesses a complete unified communications plan that results in:
- Reduced costs through economies of scale
- Increased level of support and availability, 24x7x365
- A stable and predictable IT budget
- Access to the latest technology with limited risk
- Access to enhanced skill sets
- Increased flexibility—easier to scale services up or down
- The ability to focus your IT group on the core business

Considerations for choosing the right managed services provider:
- Does the provider monitor and manage the network end-to-end?
- Can the provider secure network traffic across other networks?
- Does the provider own and operate its own network so that quality can be guaranteed?
- What measures does the provider take to ensure continuous availability and high performance?
- Will the provider deliver real-time monitoring as well as regular, thorough reports on network performance?
